Strength In Members

Protecting your data has never been more critical.

We are always looking for ways to support building strong and resilient Alberta communities.
We've developed a suite of Cyber Security Services to strengthen your understanding of your risks, provide protection, and support your recovery & response.

Understanding the potential threats and risks of your cyber security and evaluating possible solutions' importance can be overwhelming. A Threat Risk Assessment builds a complete picture of your cyber security's current state, the probability of particular threats, and the potential impact of those threats. This allows you to confidently prioritize your next steps and activate solutions.

Your organization will build an understanding of:

- where valuable data resides,
- potential gaps in protection,
- potential losses from successful attacks, and
- solutions to address gaps in security.

Make informed decisions about your cyber security through a clear understanding of the risks and likelihood of threats.

Talk to us about your risks and your security options.

Building an IT & data assets inventory

Without an understanding of your information assets and their importance, it's almost impossible to make strategic cyber security decisions.

A complete, up-to-date inventory developed through your risk assessment allows you to determine how to protect your most critical software and data assets.

Prioritizing solutions & managing costs

A threat risk assessment can help your organization eliminate unnecessary security spending.

You can identify the most unacceptable risks and channel resources toward them rather than toward less likely or less damaging risks.
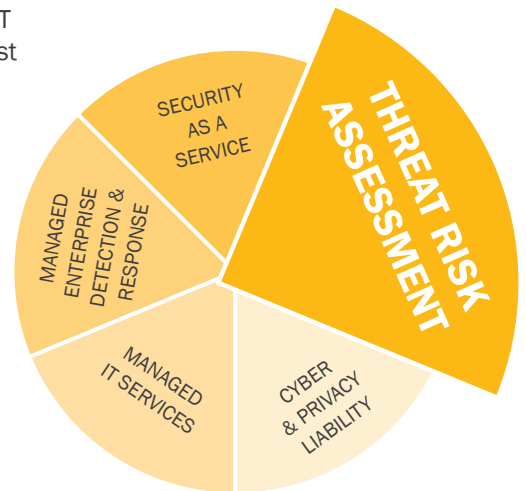

Understanding your risk profile

Identifying threats and ranking risks based on the potential for harm, determines your risk profile. Understanding your risk profile allows you to prioritize risk management tasks and allocate resources appropriately.

Identifying & reducing vulnerabilities

Comparing your cyber security objectives and your risk profile to how your IT infrastructure performs during these assessments helps determine the best steps for improving your security.
